Introduction

The [html-to-pdf](#) renderer wires together the substrate packages — [libxhtml](#), [libxhtml2](#), [libxhtml3](#) — and emits a PDF via [libxhtml4](#). See the [project site](#) for the bigger picture.

Inline semantics

Highlighted text — yellow background by default, like a print marker.

[libxhtml](#) render with an underline; [libxhtml2](#) get a line through. Both inherit `color` from the surrounding paragraph.

Water is H²O; phpdftk's spec coverage matrix is at section A¹ of the docs.

Page breaks

Page breaks

This section's heading carries `<hr style="clear: both;"/>`, so it starts on a new physical page — the cursor advances to the next page boundary before the heading lays out. Use this for chapter starts and other hard pagination requirements.

`<hr style="clear: both;"/>` works symmetrically, and `<hr style="clear: both;"/>` tells the layout to shift a block whole to the next page when it would otherwise straddle a boundary.
