

phpdfk html-to-pdf

A pure-PHP HTML & CSS renderer for paged documents.

What just happened

The renderer parsed this HTML through `phpdfk/html`, ran the cascade through `phpdfk/css` (including the box-edge and font shorthand expanders), generated a box tree, laid the blocks out top-down with shaper-driven inline wrapping, and painted backgrounds, borders, and text via the `phpdfk/pdf-writer` content stream.

Multi-page output

Content that overflows the page boundary gets sliced across as many pages as needed. Each page paints the whole tree clipped to its own MediaBox.
