

Inline links

Mixing plain paragraphs with linked paragraphs is as simple as passing a TextStyle with the link field set. Each wrapped line of the linked text gets its own link annotation, so the whole block is clickable.

[Click this paragraph to visit `phpdfkit.dev` — the official documentation site for the project.](#)

Back to plain text in between.

Long linked paragraphs wrap naturally and the entire wrapped region is clickable. Every line that the paragraph occupies is covered by its own annotation rectangle, including continuation lines on the next page when the paragraph spans a page break.
