Introduction

The **html-to-pdf** renderer wires together the substrate packages — phpdfTk/html, phpdfTk/css, phpdfTk/text, phpdfTk/font-parser — and emits a PDF via phpdfTk/pdf-writer. See the [project site](#) for the bigger picture.

Inline semantics

<mark>

Highlighted text — yellow background by default, like a print marker.

**<ins> / **

Insertions render with an underline; ~~deletions~~ get a line through. Both inherit `color` from the surrounding paragraph.

<sub> / <sup>

Water is H₂O; phpdfTk's spec coverage matrix is at section A¹ of the docs.

Page breaks

Page breaks

This section's heading carries break-before: page, so it starts on a new physical page — the cursor advances to the next page boundary before the heading lays out. Use this for chapter starts and other hard pagination requirements.

break-after: page works symmetrically, and break-inside: avoid tells the layout to shift a block whole to the next page when it would otherwise straddle a boundary.
