Introduction

The `html-to-pdf` renderer wires together the substrate packages — `html-to-pdf`, `html-to-pdf`, `html-to-pdf` — and emits a PDF via `html-to-pdf`. See the [project site](#) for the bigger picture.

Inline semantics

`html-to-pdf`

Highlighted text — yellow background by default, like a print marker.

`html-to-pdf`

render with an underline; get a line through. Both inherit `color` from the surrounding paragraph.

Water is H₂O; phpdftk's spec coverage matrix is at section A¹ of the docs.

Page breaks

This section's heading carries `<hr style="display: none; margin: 0; border: none; border-top: 1px solid black; height: 0; width: 100%;"/>`, so it starts on a new physical page — the cursor advances to the next page boundary before the heading lays out. Use this for chapter starts and other hard pagination requirements.

`<div style="display: flex; justify-content: space-between; padding: 10px 0 0 0; border-bottom: 1px solid black; margin-bottom: 10px 0 0 0; min-height: 100px; min-width: 100%; width: 100%; height: 100%;"> works symmetrically, and <div style="display: flex; justify-content: space-between; padding: 10px 0 0 0; border-bottom: 1px solid black; margin-bottom: 10px 0 0 0; min-height: 100px; min-width: 100%; width: 100%; height: 100%;"> tells the layout to shift a block whole to the next page when it would otherwise straddle a boundary.`
